SERVICE PROCEDURES

1. Replacing the fuses

For continued protection against fire hazard, replace only with same type and same rating fuse.

Circuit no.	Part no.	Description
F902	252076	△3.15A-SE-EAK, Primary fuse
F903	252075	△2.5A-SE-EAK, AC outlet fuse
F911, F912	252078	△5A-SE-EAK, Secondary fuse

2. Change of FM/AM band step

(AM)

BAND STEP	R723	D711
10kHz→9kHz	Addition	Addition
9kHz→10kHz	Eliminated	Eliminated

In R723 Carbon resistor 10kΩ

(Part No.417341034) is used.

In D711 Diode 1SS270A

(Part No.223205) is used.

3. Memory preservation

This unit does not require memory preservation batteries. A built-in memory power back-up system preserves contents of the memory during power failures and even when the unit is unplugged. The unit must be plugged in and the power switch turned on and off once in order to charge the back-up system. Note that since this is not a permanent memory the power switch must be turned on and off a few times each month to keep the back-up system operative. The period of time during which memory contents are preserved after power has last been turned off varies depending on climate and placement of the unit. On the average, memory contents are protected over a period of 3 to 4 weeks (a minimum of 2 weeks) after the last time power has been turned off. This period is shorter when the unit is exposed to very high humidity or used in an area with an extremely humid climate.

Idling Current Adjustment

Connect the DC voltmeter to the terminals P511 and P512 (VCT and IID) on the selector and power amplifier pc board. Adjust the trim resistors R509 and R510 so that the indicator of voltmeter becomes $5 \pm 0.5\text{mV}$.

NOTE: Adjust after switching on for 5 minutes.
